EFTA Redaction Comparison Report

Case Number: EFTA-ALCC-01

Examiner: Aliya Feuer-Whittlesey

Evidence: 1A, EFTA00952117-3.pdf and EFTA02230480-3.pdf

Introduction

This examination compares two versions of the same email that the U.S. Department of Justice released under two different Bates numbers, EFTA00952117 and EFTA02230480. The examiner collected both files during a manual scrape of the Department of Justice Epstein Files library and found that the same email was released twice, with the student's name redacted in one release and readable in the other. Both contain a November 17, 2017 email with the subject line "ALCC-I 20" and the message it replies to, sent that morning from jeevacation@gmail.com. The purpose of the examination was to preserve both files under a verified chain of custody, confirm their integrity throughout every tool used, and document which identifying information each release redacted and which it left readable. The work was performed in the UMGC virtual lab using FTK Imager, HashCalc, EnCase Forensic, Autopsy, FOCA, and OSForensics. The lab VM clock runs on UTC, so all times in this report are UTC as recorded by the VM.

Figure 3
HashCalc MD5 and SHA1 Values for EFTA02230480-3.pdf

Pre-Acquisition Hashing

Before any acquisition, both PDFs were placed in a folder on the VM desktop and hashed in FTK Imager, which exported the hash list in Figures 1A and 1B. EFTA00952117-3.pdf produced an MD5 of 6c80153bb9e6e3bc8685376c38b4c230 and a SHA1 of 38169432965ad3986d85523193d9ba63d2a89605. EFTA02230480-3.pdf produced an MD5 of eed5ae82d8412fb0085883f0af6d326e and a SHA1 of 5d872a36cd106de863b4b12ab463f5957695580e. HashCalc returned identical values for both files (Figures 2 and 3), so every later hash could be checked against two tools.

Staging and Acquisition

The PDFs were copied to the ALIYA-FAT32 (G:) volume, which held no other user files (Figure 4). FTK Imager then acquired G: as a logical drive in raw (dd) format to H:\EFTA Image\EFTA ALCC Drive.001, under case number EFTA-ALCC-01 and evidence number 1A (Figure 6A). Acquisition ran from 22:43:23 to 22:43:46 on October 1, 2026, and covered 2,091,008 sectors of

512 bytes. FTK Imager's verification computed an MD5 of d82345fc7b0d54e50f441f164dbc539f and a SHA1 of 04cbf57a2ec084ecf691ae80a128eed2a13e8a3f, both matching the acquisition hashes, with no bad blocks found (Figures 5A and 5B). The image log records the same values as verified, with verification running from 22:43:47 to 22:43:53 (Figure 6B).

The FTK Imager directory listing confirms both PDFs inside the image at the root of the FAT32 volume (Figures 7A and 7B). EFTA02230480-3.pdf is 88,378 bytes, and EFTA00952117-3.pdf is 54,220 bytes. Both show a creation time of 22:23:21 on October 1, 2026, when they were

copied to G:, and a modified time of 21:16:56, from when they were first copied to the VM. Neither file is marked deleted.

EnCase Examination

A new EnCase case, EFTA-ALCC-01, was created for the image (Figures 8A and 8B), and EFTA ALCC Drive.001 was added as evidence (Figure 9A). EnCase reported the file integrity status as "Evidence cannot be verified" (Figure 9B), the expected result for a raw image, which carries no embedded hash for EnCase to check against. Integrity was instead confirmed by comparing EnCase's file hashes to the earlier baselines. The Entries view lists both PDFs at the root of the drive as documents with logical sizes matching the directory listing (Figure 10). EnCase's Hash\Sig Selected function returned MD5 and SHA1 values for both PDFs identical to Figures 1 through 3 (Figures 11A and 11B).

Autopsy Examination

A matching Autopsy case was created under the same case number and examiner (Figures 12A and 12B), and the image was added as a data source. Autopsy's file listing shows both PDFs with MD5 values matching every prior tool (Figure 13). Autopsy's container summary for the image reports a size of 1,070,596,096 bytes, an MD5 of d82345fc7b0d54e50f441f164dbc539f, and a SHA1 of 04cbf57a2ec084ecf691ae80a128eed2a13e8a3f, matching the FTK Imager acquisition and verification hashes (Figures 14A and 14B).

Keyword Search Results

A keyword search for “Anna” returned one result, EFTA02230480-3.pdf, matching its MD5 (Figures 15A and 15B). Autopsy’s extracted text shows two hits in that file (Figures 15C and 15D). The first is in the reply, “I am waiting for Anna to get back to me with her reference number she should have received when she applied for ALCC.” The second is in the quoted 8:51 AM message, which identifies ALCC as the English language school that “anna in paris would like to join,” asks for an I-20 to be issued and a visa obtained, states that she is Russian but staying in Paris, and asks for the school to be called about how long issuance would take if payment were made that day. The header of this version is redacted. The From line is blank, and the recipient appears only as an OCR-garbled address.

A keyword search for “Groff” returned one result, EFTA00952117-3.pdf (Figures 16A and 16B). The extracted text of this version shows the header unredacted: “From: Lesley Groff” and “To: Jeffrey Epstein jeevacation@gmail.com,” with a date of November 17, 2017 at 17:31:28 +0000 (Figures 16C and 16D). The body is the same reply and quoted message as EFTA02230480, but the name is missing in both places where “Anna” appears in the other version. The text layer reads “I am waiting fora to get back to me” and “ALCC. les this is the english language school that in paris,” leaving OCR artifacts where the redactions sit.

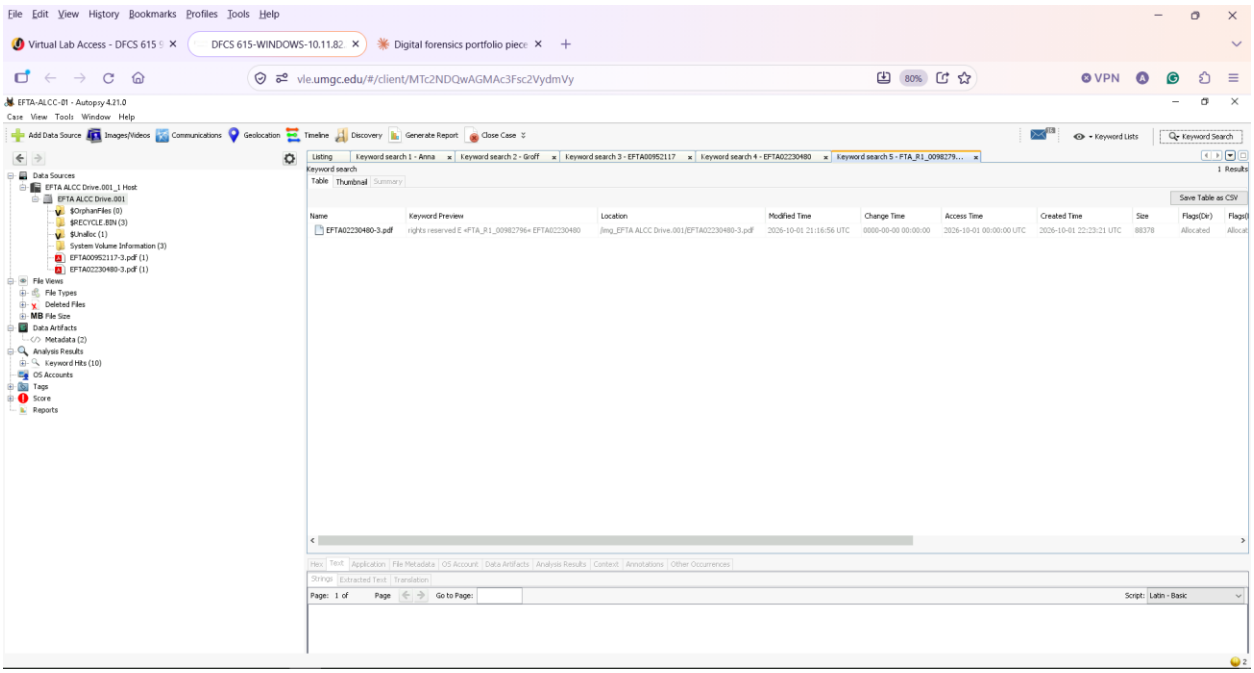

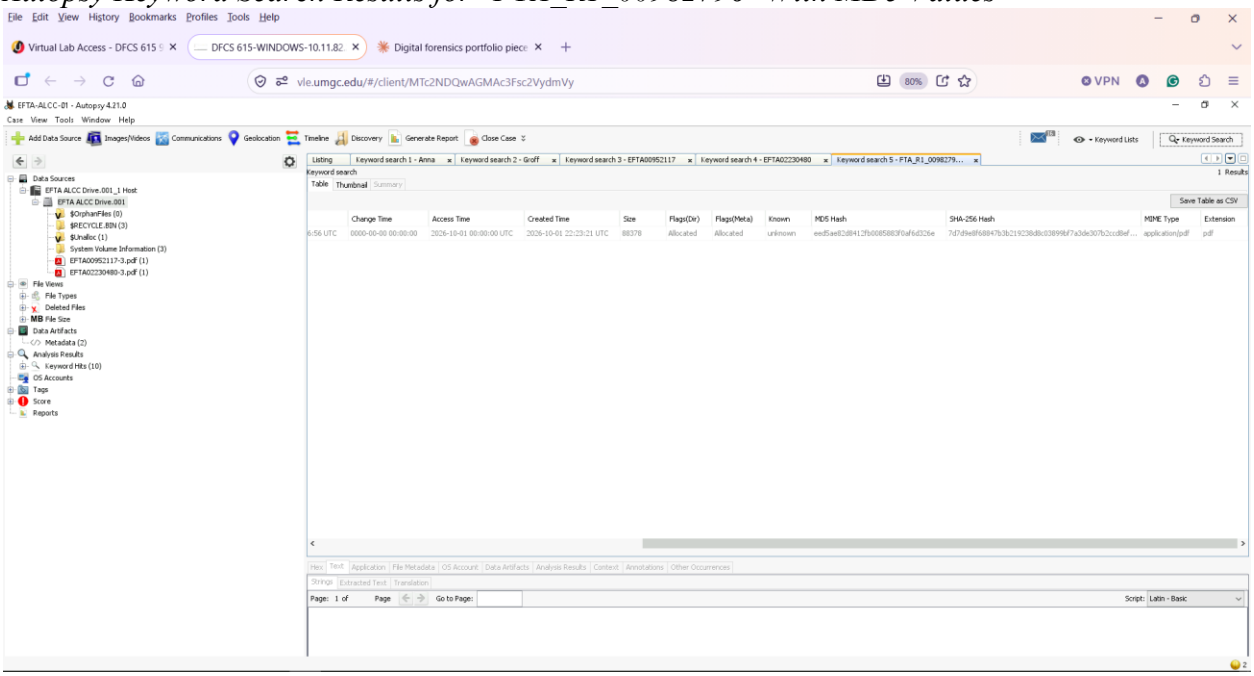

Figure 19B

Autopsy Keyword Search Results for "FTA_R1_00982796" With MD5 Values

The two releases are redacted differently. EFTA00952117 hides the student's name and exposes the sender and recipient. EFTA02230480 hides the sender and exposes the student's name. Together, they identify Lesley Groff as the sender reporting to Jeffrey Epstein about efforts to have ALCC issue an I-20 for a Russian student named Anna. Groff's reply states that the man she spoke to at ALCC could not find Anna's name in the system, that an I-20 cost $2,012 for the first three months, and that she had called the school seven times.

Searches on the Bates numbers confirm which file carries which identifier. “EFTA00952117” returned two results, EFTA00952117-3.pdf and a 3,124-byte slack entry for that file (Figures 17A and 17B). “EFTA02230480” returned two results, EFTA02230480-3.pdf and a 1,734-byte slack entry for that file (Figures 18A and 18B). EFTA02230480 also bears a second stamp, which the OCR layer reads as “E FTA_R1_00982796” (Figure 15D). A search for “FTA_R1_00982796” returned one result, EFTA02230480-3.pdf, and no hit in EFTA00952117 (Figures 19A and 19B). This places EFTA02230480 in an earlier R1 production under EFTA_R1_00982796, before its current Bates number was applied.

Metadata

Autopsy's extracted metadata shows both files as single-page PDF 1.3 documents with a creator tool of OmniPage CSDK 21.1, an OCR engine, and a producer of Processing-CLI (Figures 15E and 16E). EFTA00952117 records a creation and modification time of 2026-01-30T00:46:08Z. EFTA02230480 records 2026-01-30T01:07:22Z. The two files were generated about 21 minutes apart on the same day by the same OCR and processing software, yet each received different redactions. Both PDFs were exported from the image through Autopsy to H:\FOCA Export (Figure 20). HashCalc confirmed that the exported copies, 19-EFTA00952117-3.pdf and 17-EFTA02230480-3.pdf, match the original MD5 and SHA1 values (Figures 21A and 21B). A FOCA project was created for the case (Figure 22), and both files were loaded and analyzed (Figures 23 and 24). FOCA logged metadata extraction for both files but returned zero users, folders, printers, software, emails, operating systems, passwords, or servers, and its file information view lists only path, download date, and size (Figures 25A and 25B). FOCA did not parse the document information that Autopsy's parser read from the same files.

Note: The Description of Evidence entry for item 1A reads in full: EFTA00952117-3.pdf (MD5 6c80153bb9e6e3bc8685376c38b4c230) and EFTA02230480-3.pdf (MD5 eed5ae82d8412fb0085883f0af6d326e), exported from EFTA ALCC Drive.001.

Figure 26C

OSForensics Chain of Custody for EFTA-ALCC-01

Case Documentation

The examination was recorded as case EFTA-ALCC-01 in OSForensics, with the acquisition type set to investigating disks from another machine and the time zone set to GMT 0:00 (Figure 26A). Evidence 1A was entered with a quantity of two (Figure 26B), and the chain of custody records five transfers (Figure 26C). The files were obtained from the U.S. Department of Justice public release on February 14, 2026, moved from the examiner's computer to the UMGC lab VM at 21:16 on October 1, 2026, copied to ALIYA-FAT32 (G:) at 22:23, imaged to H:\EFTA Image\EFTA ALCC Drive.001 at 22:43, and exported from the image through Autopsy to H:\FOCA Export at 20:13 on October 2, 2026. OSForensics records chain-of-custody times to the minute, so the seconds shown in Figure 26C are filled in by the software and do not reflect the seconds in Figures 6B and 7B.

PDF Structure

The exported copies were opened in the OSForensics Hex/String Viewer to examine how each PDF was built. Both files begin with a PDF 1.3 header and contain three revisions appended as incremental updates: the first contains the scanned page, the second adds the OCR text layer, and the third adds the Bates stamp. In 17-EFTA02230480-3.pdf, the first revision defines the page with a MediaBox of 0 0 612 804.75 (Figure 27A), and the third revision redefines it as 0.0 -18 612 804.75, extending the page 18 points below its original bottom edge to make room for the stamp (Figure 27B). The page content is a single image, 816 by 1073 pixels (Figure 27C). The redaction boxes are part of that image, and the file contains no separate drawn objects covering the redacted areas, so no text sits underneath a box to be recovered. The document information dictionary records a creation and modification date of D:20260130010722 (Figure 27D), matching the time Autopsy extracted. The second revision opens with the comment 3.5-LNX2110-20508.1000 and adds the OCR text layer (Figure 27E). Because that layer was generated from the already redacted image, it lacks the redacted words. The third revision writes the Bates number into the added strip as Helvetica text stored in hexadecimal, 4546544130323233303430, which decodes to EFTA02230480 (Figure 27F). This revision does not include the R1 number. It exists only inside the scanned image, which is why the OCR layer split it as “E FTA_R1_00982796,” while the current Bates number, stored as text, was extracted intact. The page image is stored in the DeviceGray color space (Figure 27G).

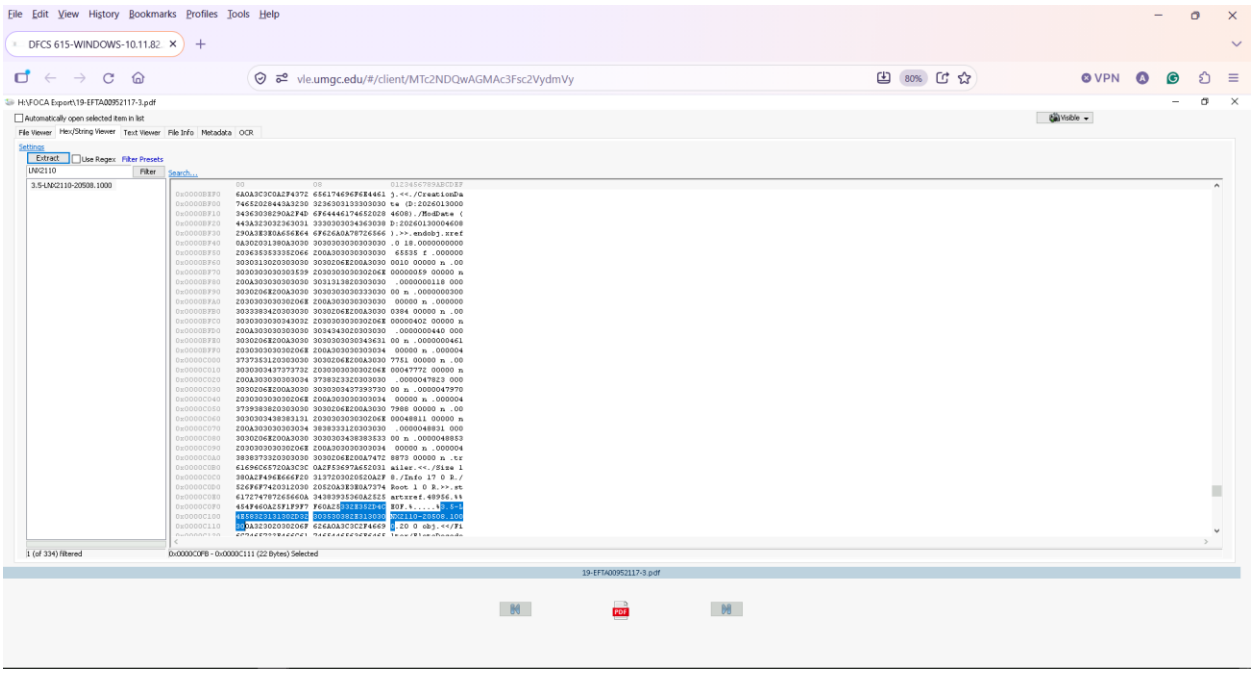

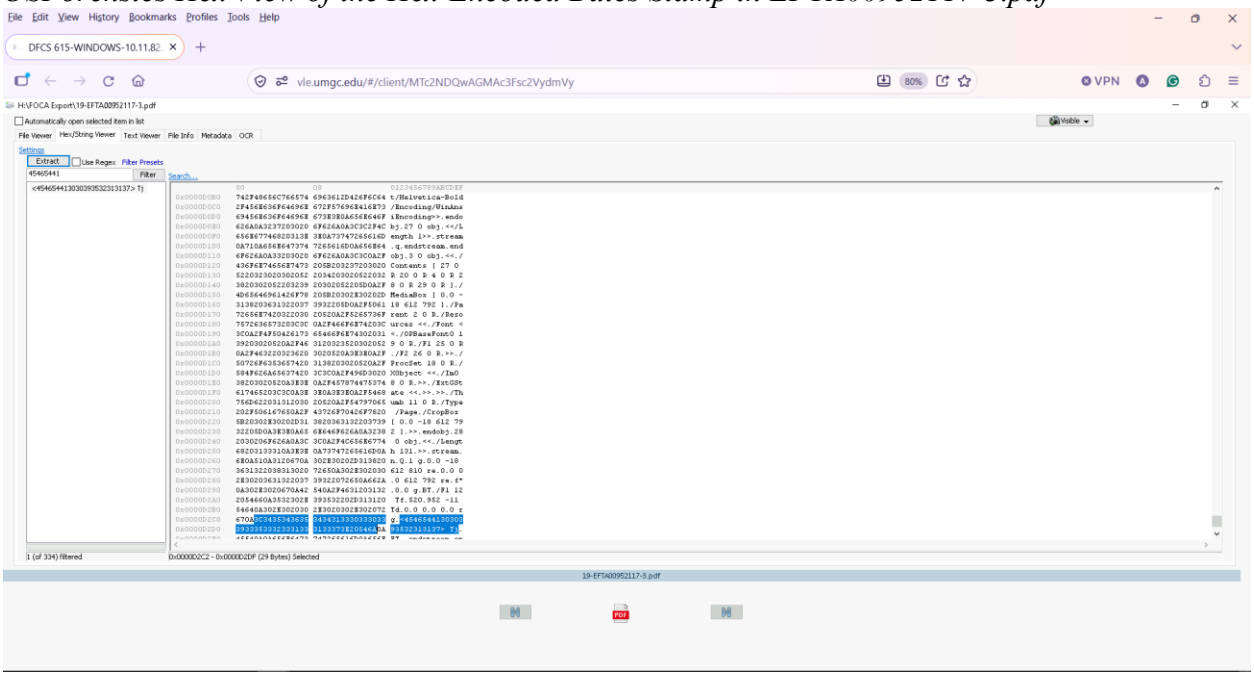

Figure 28F
OSForensics Hex View of the Hex-Encoded Bates Stamp in EFTA00952117-3.pdf

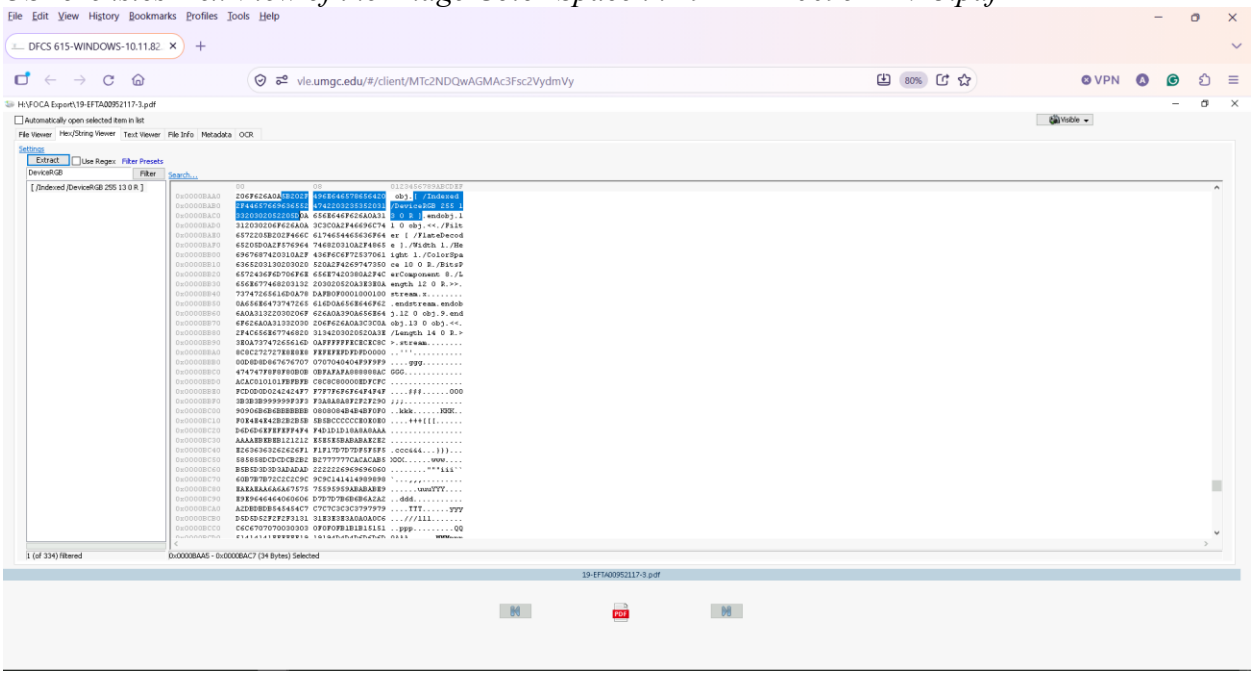

19-EFTA00952117-3.pdf follows the same structure with different values. The first revision defines the page with a MediaBox of 0 0 612 792 (Figure 28A), and the third revision extends it to 0.0 -18 612 792 (Figure 28B). The page image is 816 by 1056 pixels, again with the redactions part of the image and no separate covering objects (Figure 28C). The creation and modification date is D:20260130004608 (Figure 28D). The second revision opens with the same comment, 3.5-LNX2110-20508.1000, and adds the OCR text layer (Figure 28E), which accounts

for the OCR artifacts where the redactions sit in Figures 16C and 16D. The third revision writes the Bates number as 4546544130303935323131 37, which decodes to EFTA00952117 (Figure 28F). The page image is stored as an indexed DeviceRGB palette of 256 colors (Figure 28G), which is why the email links appear blue in this version and gray in EFTA02230480. The different page heights, image dimensions, and color spaces show the two versions were made separately, not as one copy of the other with altered redactions.

Conclusion

Both EFTA PDFs kept the same MD5 and SHA1 values across FTK Imager, HashCalc, EnCase, Autopsy, and the exported copies, and the image hash computed by FTK Imager matched Autopsy's independent calculation. The files did not change from staging through export. The examination shows that the Department of Justice redacted two productions of the same email inconsistently, so that each release shows what the other hides. EFTA00952117 identifies Lesley Groff and Jeffrey Epstein as the parties, and EFTA02230480 identifies the student as Anna. Reading both releases together reveals both. Each redaction is burned into its page image, and the text layer was generated afterward, so neither file leaks redacted text on its own. The names are exposed only because the two releases were redacted differently. The R1 stamp on EFTA02230480, the separate creation times, and the different page dimensions and color spaces show the email moved through more than one production, and the redactions were not reconciled between them.
